1.8 Test the Connection .....	25

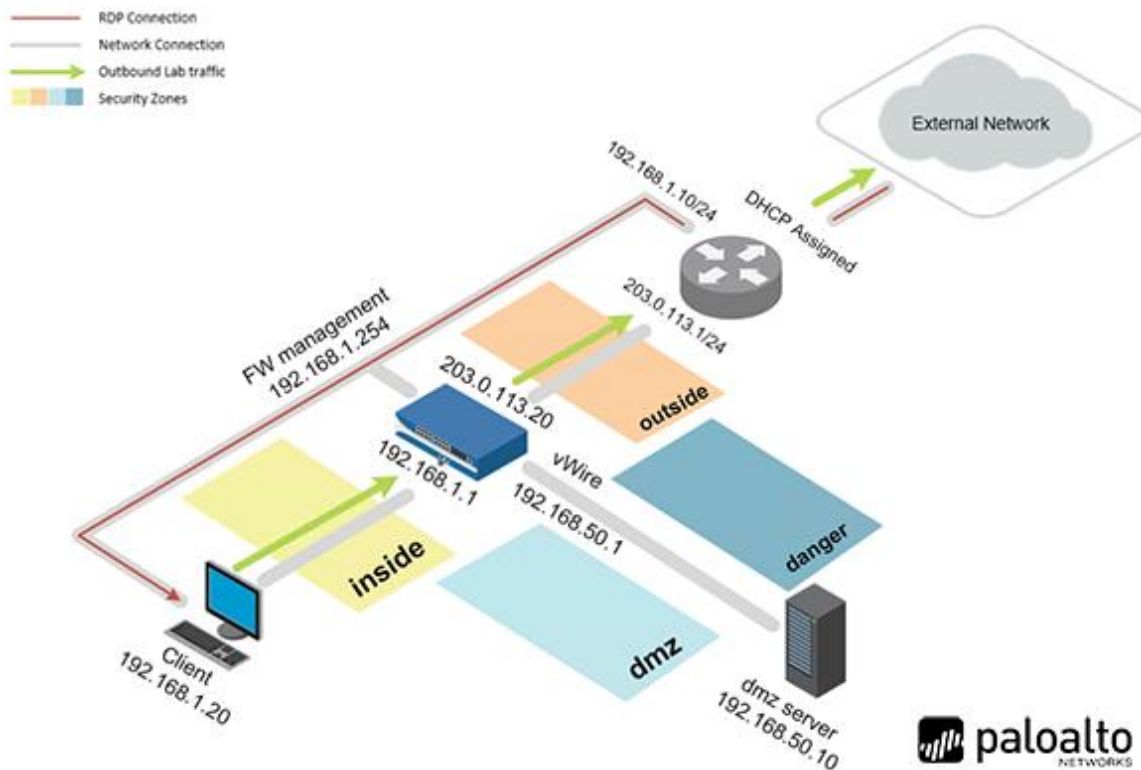

## Introduction

The interfaces are configured and working, but we can't pass traffic through the appliance yet. That is because we need to set up our NAT and Security policies to allow our systems to communicate with the outside world. Now, we are going to configure those policies. We will have to revise them later as we grow, but this should get us to the internet.

## Objectives

- Create tags for later use with Security policy rules
- Create a basic source NAT rule to allow outbound access and an associated Security policy rule to allow the traffic
- Create a destination NAT rule for FTP server and an associated Security policy rule to allow the traffic

## Lab Topology

## Theoretical Lab Topology

## Lab Settings

The information in the table below will be needed in order to complete the lab. The task sections below provide details on the use of this information.

Virtual Machine	IP Address	Account (if needed)	Password (if needed)
Client	192.168.1.20	lab-user	Pa10Alt0
Firewall	192.168.1.254	admin	admin

## 1 Security and NAT Policies

### 1.0 Load Lab Configuration

1. Launch the **Client** virtual machine to access the graphical login screen.

To launch the console window for a virtual machine, you may access by either clicking on the machine's graphic image from the topology page or by clicking on the machine's respective tab from the navigation bar.

2. Click within the splash screen to bring up the login screen. Log in as **lab-user** using the password **Pa10A1t0**.

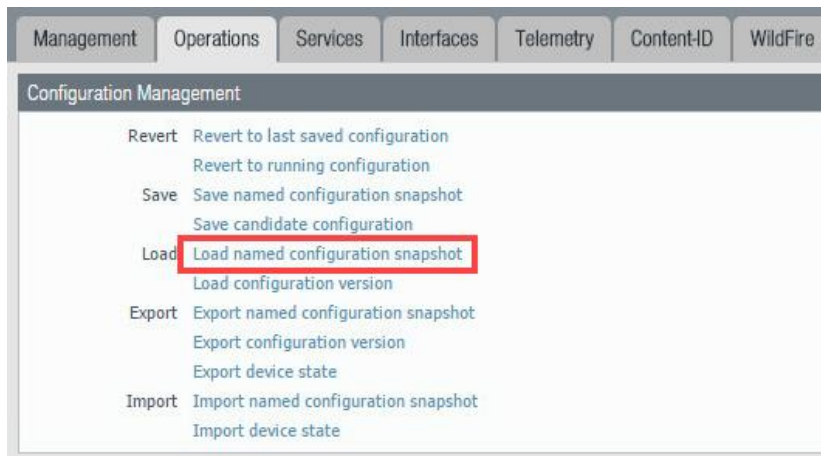

3. Launch the **Chrome** browser and connect to **https://192.168.1.254**.
4. If a security warning appears, click **Advanced** and proceed by clicking on **Proceed to 192.168.1.254 (unsafe)**.
5. Log in to the *Palo Alto Networks* firewall using the following:

Parameter	Value
Name	<b>admin</b>
Password	<b>admin</b>

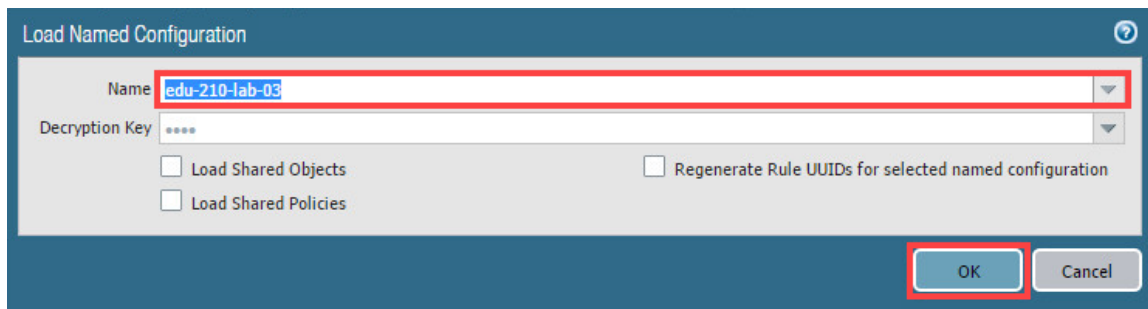

6. In the firewall web interface, navigate to **Device > Setup > Operations**.

7. Click **Load named configuration snapshot**:

8. Select **edu-210-lab-03** and click **OK**.

9. Click **Close**.

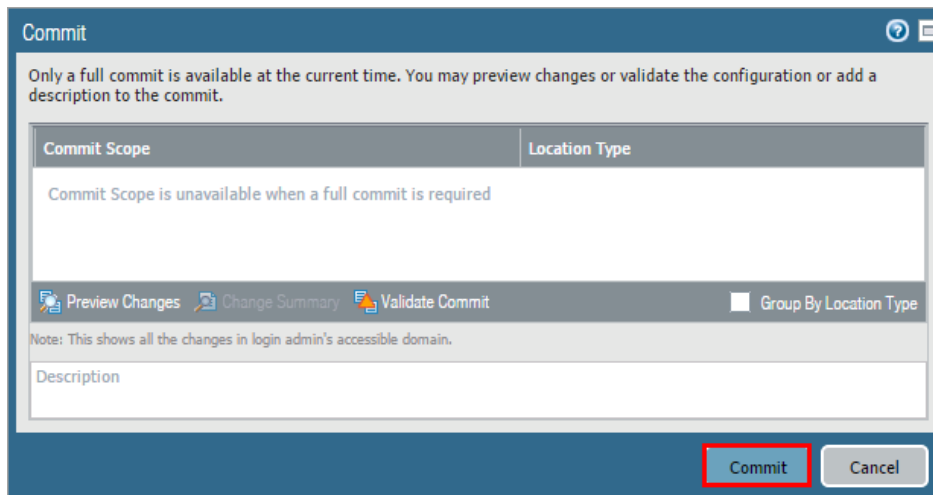

The following instructions are the steps to execute a **“Commit All”** as you will perform many times throughout these labs.

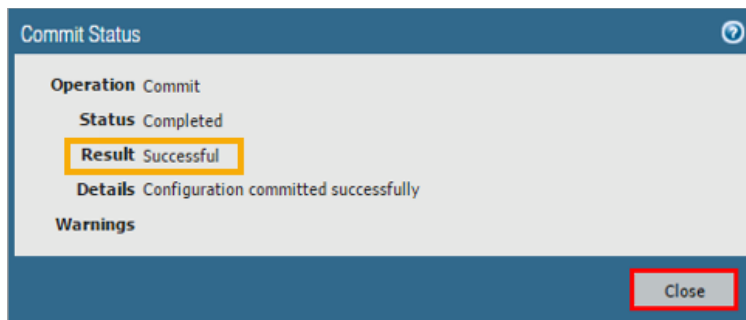

10. Click the **Commit** link at the top-right of the web interface.

11. Click **Commit** and wait until the commit process is complete.

12. Once completed successfully, click **Close** to continue.

13. Leave the firewall web interface open to continue with the next task.

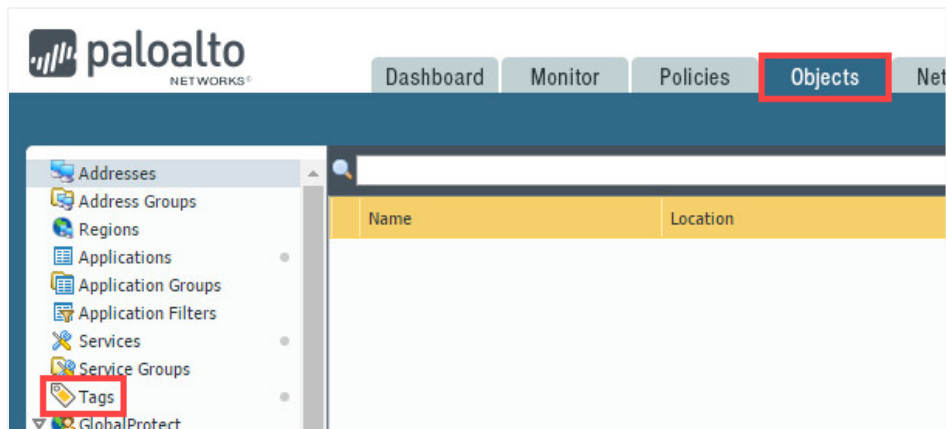

## 1.1 Create Tags

Tags are color-coded labels that enable you to group, sort, and filter objects using keywords or phrases. Tags can be applied to Address objects, Address Groups (static and dynamic), services, Service Groups, and policy rules. Tags can be assigned a color that makes the results of a search easier to find in the web interface.

When used with Comments or Descriptions, Tags can help administrators to determine more easily how a firewall has been configured and the purpose of its various rules, objects, and entries. In the following steps, you will assign a description to a tag, assign a color to the tag, and apply the tag to different policies.

1. In the web interface, navigate to **Objects > Tags**.

2. Click on **Add** located near the bottom to define a new tag.

3. In the *Tag* window, configure the following and then click **OK**.

Parameter	Value
Name	Select <b>danger</b>
Color	<b>Purple</b>
Comments	<b>Danger Tag</b>

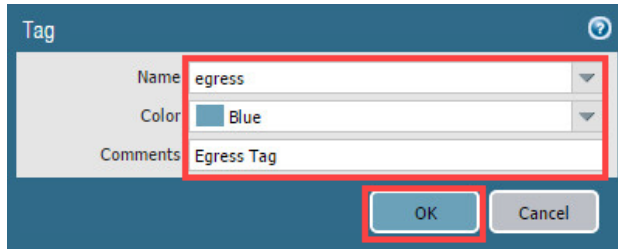

The firewall allows you to create tags based on existing Security zones, which is why *danger*, *dmz*, *outside*, and *inside* already appear in the drop-down list.

4. Click **Add** again to define another new tag.

5. In the *Tag* window, configure the following and then click **OK**.

Parameter	Value
Name	Type <b>egress</b>
Color	<b>Blue</b>
Comments	Type <b>Egress Tag</b>

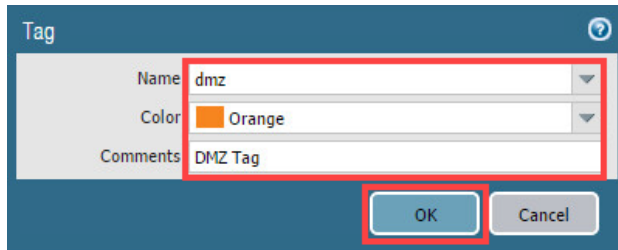

6. Click **Add** again to define another new tag.

7. In the *Tag* window, configure the following and then click **OK**.

Parameter	Value
Name	Select <b>dmz</b>
Color	<b>Orange</b>
Comments	<b>DMZ Tag</b>

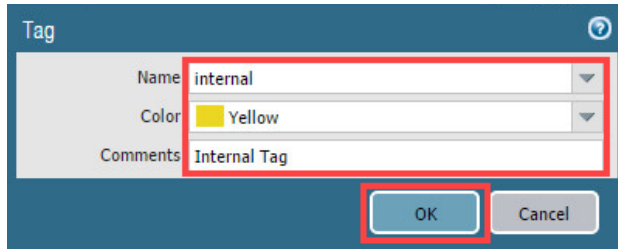

8. Click **Add** again to define another.

9. In the *Tag* window, configure the following and then click **OK**.

Parameter	Value
Name	Type <i>internal</i>
Color	<b>Yellow</b>
Comments	<b>Internal Tag</b>

10. Verify that your configuration is like the following:

<input type="checkbox"/> Name	Location	Color	Comments
<input type="checkbox"/> Sanctioned	Predefined	 Olive	
<input type="checkbox"/> empty	Predefined		
<input type="checkbox"/> danger		 Purple	Danger Tag
<input type="checkbox"/> egress		 Blue	Egress Tag
<input type="checkbox"/> dmz		 Orange	DMZ Tag
<input type="checkbox"/> internal		 Yellow	Internal Tag

If you create a Tag and use the same name you used for a Security zone, the firewall will apply that tag to the appropriate Security zone in any tables where zones are displayed. Note that the label you create for a zone must match exactly, including lowercase and uppercase.

11. Leave the firewall web interface open to continue with the next task.

## 1.2 Create a Source NAT Policy

The firewall typically uses Source NAT to translate traffic from internal hosts (often on private networks) to a public, routable address (often an interface on the firewall itself). NAT rules provide address translation and are different from Security policy rules, which allow and deny packets. You can configure a NAT policy rule to match a packet's source and destination zone, destination interface, source and destination address, and service.

1. In the web interface, navigate to **Policies > NAT**.

2. Located near the bottom, click **Add** to define a new source NAT policy.

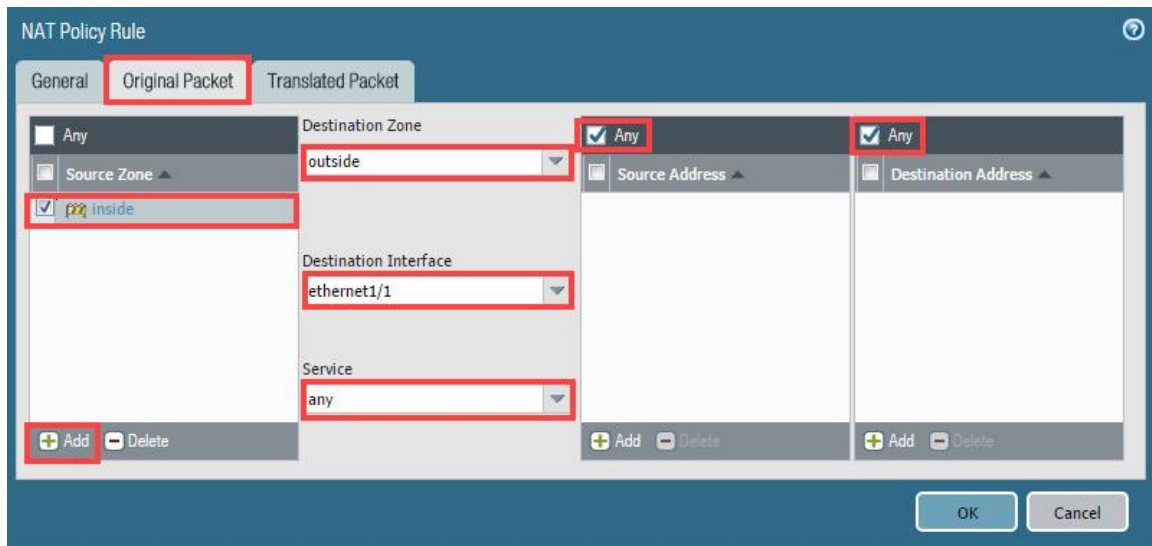

3. In the *NAT Policy Rule* window, configure the following:

Parameter	Value
Name	source-egress-outside
Tags	Select <b>egress</b> from the drop-down list
Group Rules By Tag	Select <b>egress</b> from the drop-down list
NAT Type	Verify that <b>ipv4</b> is selected
Audit Comment	Type <code>Created egress NAT Policy on &lt;date&gt; by admin</code>

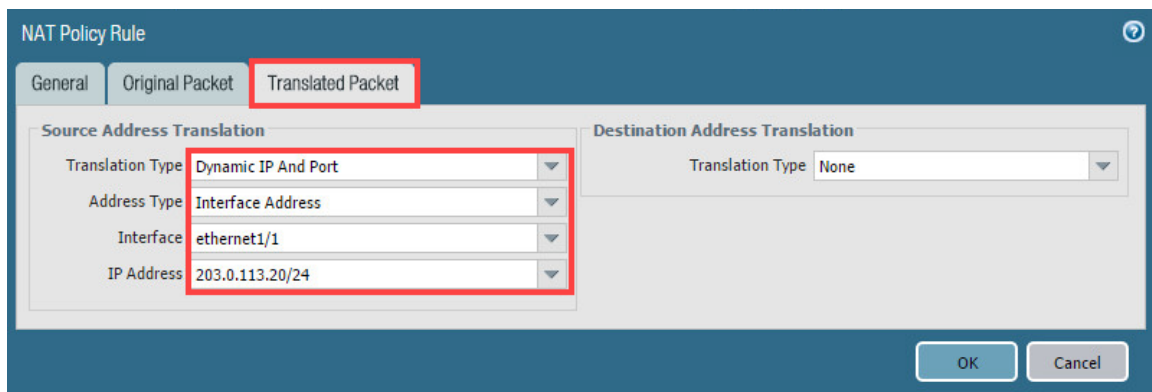

4. In the *NAT Policy Rule* window, click the **Original Packet** tab and configure the following:

Parameter	Value
Source Zone	Click <b>Add</b> and select the <b>inside</b> zone
Destination Zone	Select <b>outside</b> from the drop-down list
Destination Interface	Select <b>ethernet1/1</b> from the drop-down list
Service	Verify that <b>any</b> is selected
Source Address	Verify that the <b>Any</b> checkbox is selected
Destination Address	Verify that the <b>Any</b> checkbox is selected

5. In the *NAT Policy Rule* window, click the **Translated Packet** tab and configure the following. Click **OK** when finished.

Parameter	Value
Translation Type	<b>Dynamic IP And Port</b>
Address Type	<b>Interface Address</b>
Interface	<b>ethernet1/1</b>
IP Address	Select <b>203.0.113.20/24</b> (Make sure to select the interface IP address, do not type it.)

You will not be able to access the internet yet because you still need to configure a Security policy to allow traffic to flow between zones.

6. Leave the firewall web interface open to continue with the next task.

### 1.3 Create Security Policy Rules

Security policy rules reference Security zones and enable you to allow, restrict, and track traffic on your network based on the application, user or user group, and service (port and protocol).

1. In the web interface, navigate to **Policies > Security**.

2. Click **Add** to define a Security policy rule (located near the bottom).

3. In the *Security Policy Rule* window, configure the following:

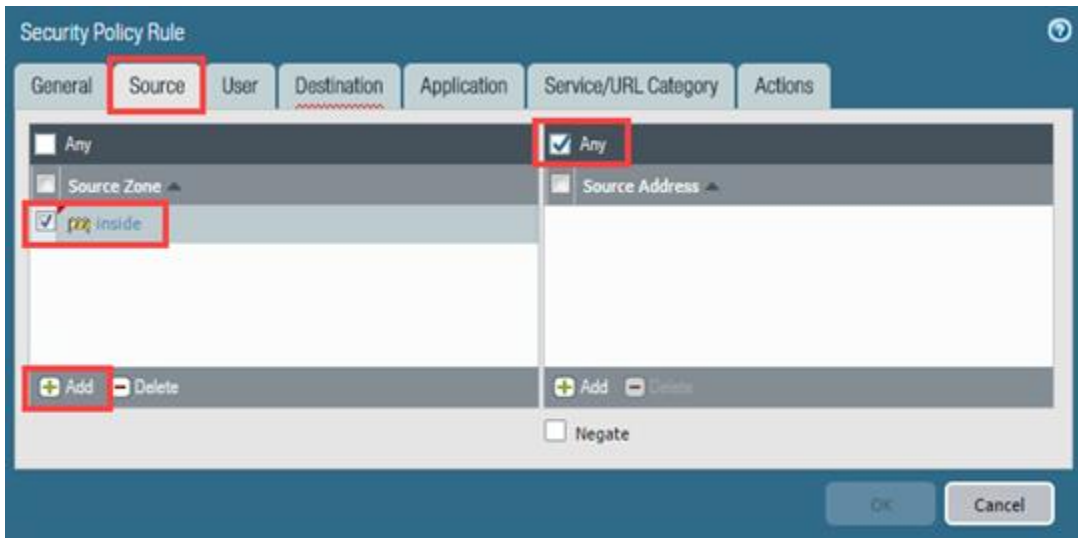

Parameter	Value
Name	<b>egress-outside</b>
Rule Type	<b>universal (default)</b>
Tags	<b>egress</b>
Group Rules By Tag	<b>egress</b>
Audit Comment	Type Created egress-outside Security Policy on <date> by admin

The image shows the 'Security Policy Rule' configuration window. The 'General' tab is selected. The 'Name' field is 'egress-outside'. The 'Rule Type' is 'universal (default)'. The 'Tags' field is 'egress'. The 'Group Rules By Tag' is 'egress'. The 'Audit Comment' is 'Created egress-outside Security Policy on 08/08/2019 by admin'. The 'OK' and 'Cancel' buttons are at the bottom right.

4. In the *Security Policy Rule* window, click the **Source** tab and configure the following:

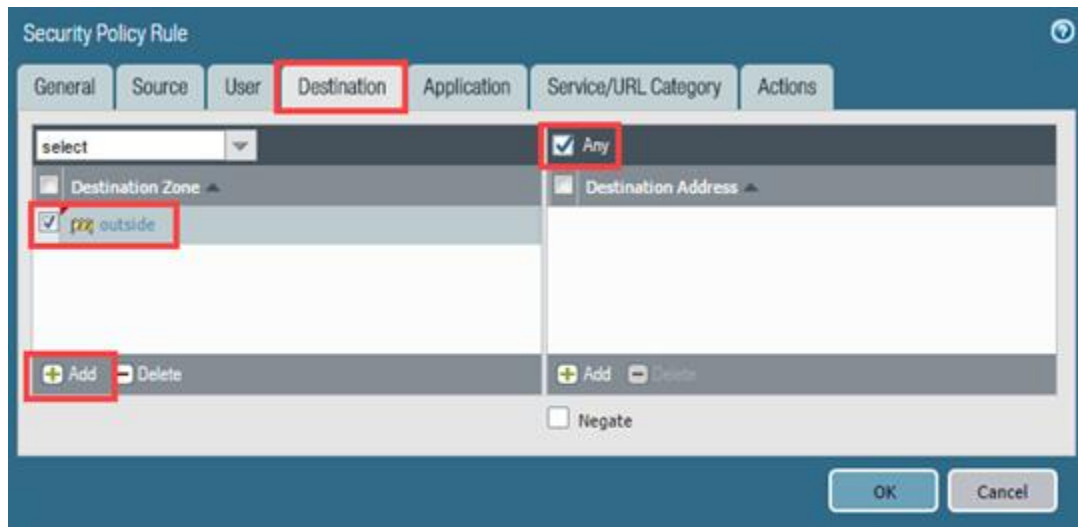

Parameter	Value
Source Zone	Click <b>Add</b> and select <b>inside</b>
Source Address	Verify that the <b>Any</b> checkbox is selected

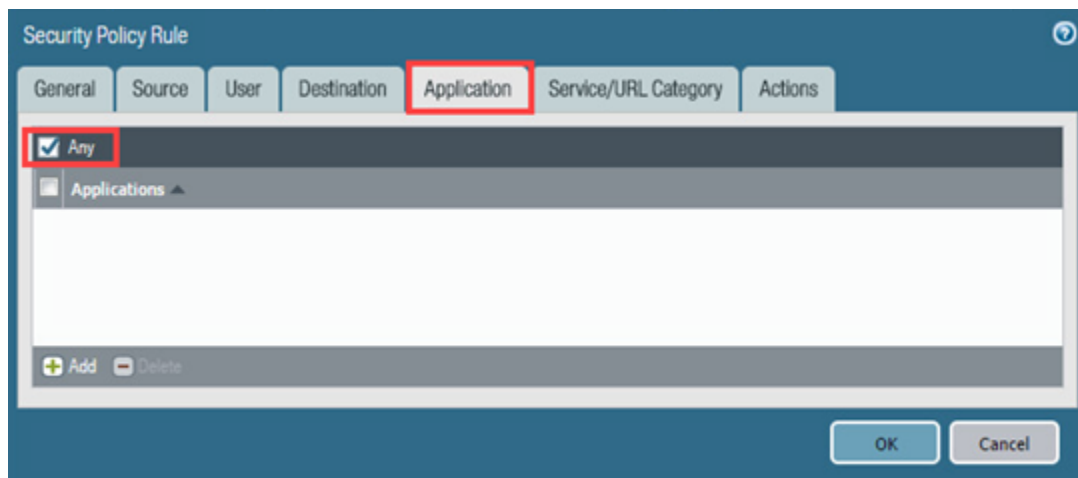

The image shows the 'Security Policy Rule' configuration window with the 'Source' tab selected. The 'Any' checkbox is checked. The 'Source Zone' dropdown is set to 'inside'. The 'Source Address' dropdown is set to 'Any'. The 'Add' and 'Delete' buttons are at the bottom left. The 'Negate' checkbox is at the bottom right. The 'OK' and 'Cancel' buttons are at the bottom right.

5. In the *Security Policy Rule* window, click the **Destination** tab and configure the following:

Parameter	Value
Destination Zone	Click <b>Add</b> and select <b>outside</b>
Destination Address	Verify that the <b>Any</b> checkbox is selected

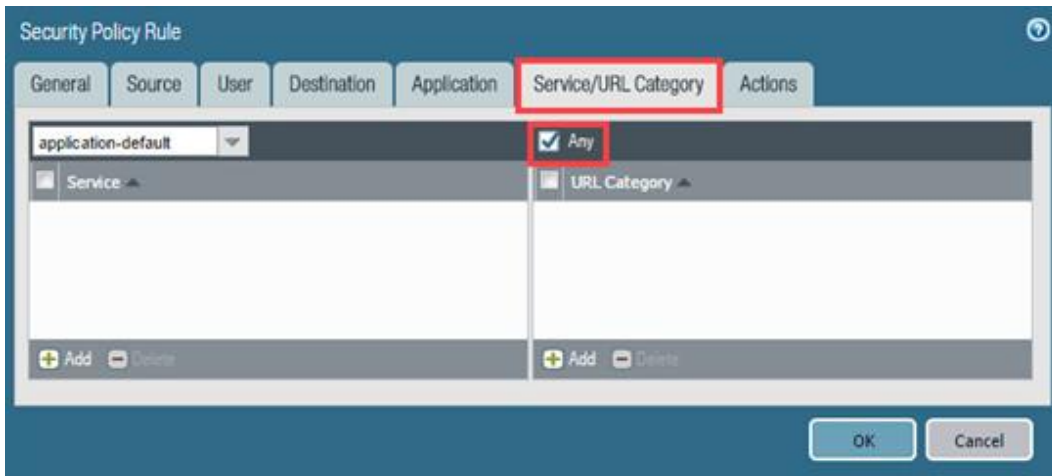

6. In the *Security Policy Rule* window, click the **Application** tab and verify that **Any** is checked.

We will use the *Any* setting for this rule now because we have not discussed applications yet. Typically, your security rules will allow only those applications that you sanction for use in your network.

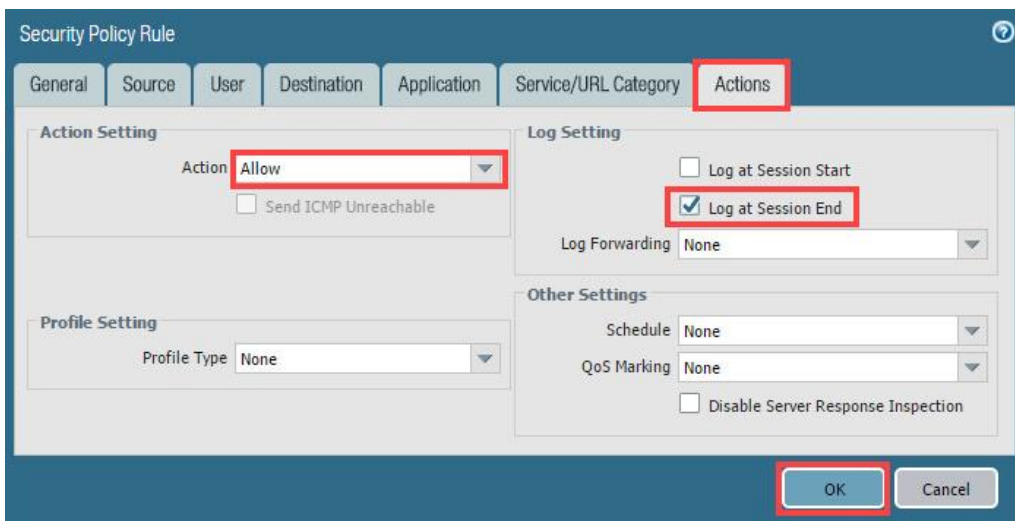

- In the *Security Policy Rule* window, click the **Service/URL Category** tab and verify that **Any** is selected.

The screenshot shows the 'Security Policy Rule' window with the 'Service/URL Category' tab selected. The 'Any' checkbox is checked and highlighted with a red box. The 'Service' and 'URL Category' lists are empty. The 'Add' and 'Delete' buttons are visible at the bottom of each list. The 'OK' and 'Cancel' buttons are at the bottom right.

- In the *Security Policy Rule* window, click the **Actions** tab and verify the following. Click **OK** when finished.

Parameter	Value
Action Setting	Verify that <i>Action</i> is set to <b>Allow</b>
Log Setting	Verify that the <b>Log at Session End</b> checkbox is selected

The screenshot shows the 'Security Policy Rule' window with the 'Actions' tab selected. The 'Action' dropdown is set to 'Allow' and highlighted with a red box. The 'Log at Session End' checkbox is checked and highlighted with a red box. The 'Log Forwarding' dropdown is set to 'None'. The 'Profile Type' dropdown is set to 'None'. The 'Schedule' and 'QoS Marking' dropdowns are set to 'None'. The 'Disable Server Response Inspection' checkbox is unchecked. The 'OK' button is highlighted with a red box.

The setting for *Log at Session End* instructs the firewall to write an entry in the Traffic log after a session has dropped from the Session table. If you enable *Log at Session Start*, the firewall will create an entry when a session is established in the session table. *Log at Session End* is the recommended setting, though you can enable both simultaneously to help troubleshoot a specific rule.

- Commit** all changes.

## 1.4 Verify Internet Connectivity

In this section, you will test the configuration of your NAT and Security policies by accessing different websites on the internet.

1. Test internet connectivity by opening **Internet Explorer** in private/incognito mode and browse to **msn.com** and **shutterfly.com**.

2. Change focus to the firewall web interface and navigate to **Monitor**, expand **Logs**, and click on **Traffic**.

3. Traffic log entries should be present based on the internet test. Verify that there is allowed traffic that matches the Security policy rule *egress-outside*.

Destination	To Port	Application	Action	Rule
159.127.41...	443	ssl	allow	egress-outside
162.248.16...	443	ssl	allow	egress-outside
162.248.16...	443	ssl	allow	egress-outside

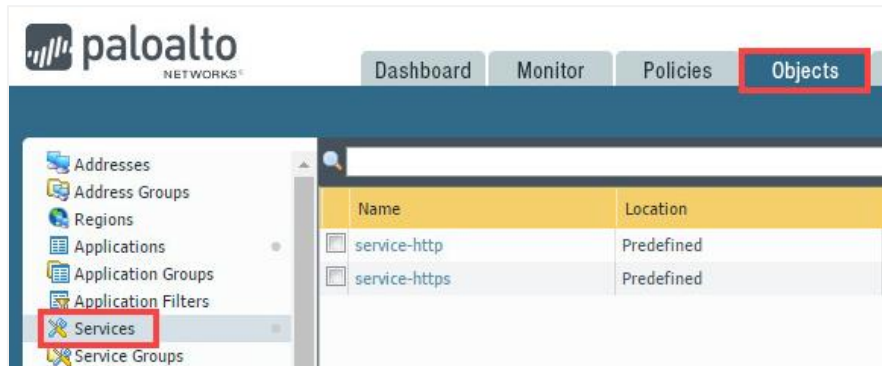

If a filter is in place, clear it to see all traffic. If entries are not present, click the refresh icon next to the *Help* icon.

4. Leave the firewall web interface open to continue with the next task.

## 1.5 Create FTP Service

When you define Security policy rules for specific applications, you can select one or more services that limit the port numbers that the applications can use.

1. In the web interface, navigate to **Objects > Services**.

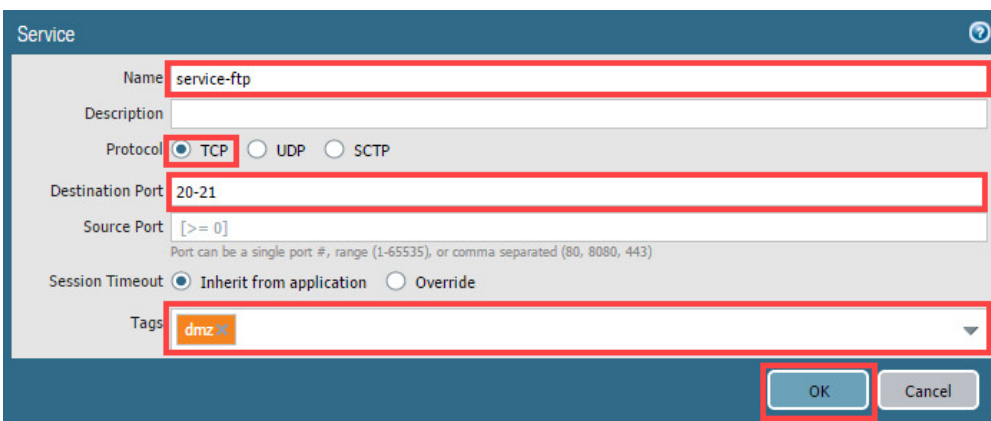

2. Click **Add** to create a new service.

3. In the *Service* window, configure the following and then click **OK** when finished.

Parameter	Value
Name	<b>service-ftp</b>
Protocol	Verify that the <b>TCP</b> radio button is selected
Destination Port	Type <b>20-21</b>
Tags	Select <b>dmz</b> from the drop-down list

The host in the DMZ is preconfigured with an FTP server. This service matches the standard control and data ports for FTP.

4. Leave the firewall web interface open to continue with the next task.

## 1.6 Create a Destination NAT Policy

You are configuring destination NAT in the lab to get familiar with how destination NAT works, not because it is necessary for the lab environment. You will connect from the Windows host (192.168.1.20) to an interface address on the firewall (192.168.1.1). The firewall will translate this connection to the DMZ server at 192.168.50.10.

1. In the web interface, navigate to **Policies > NAT**.

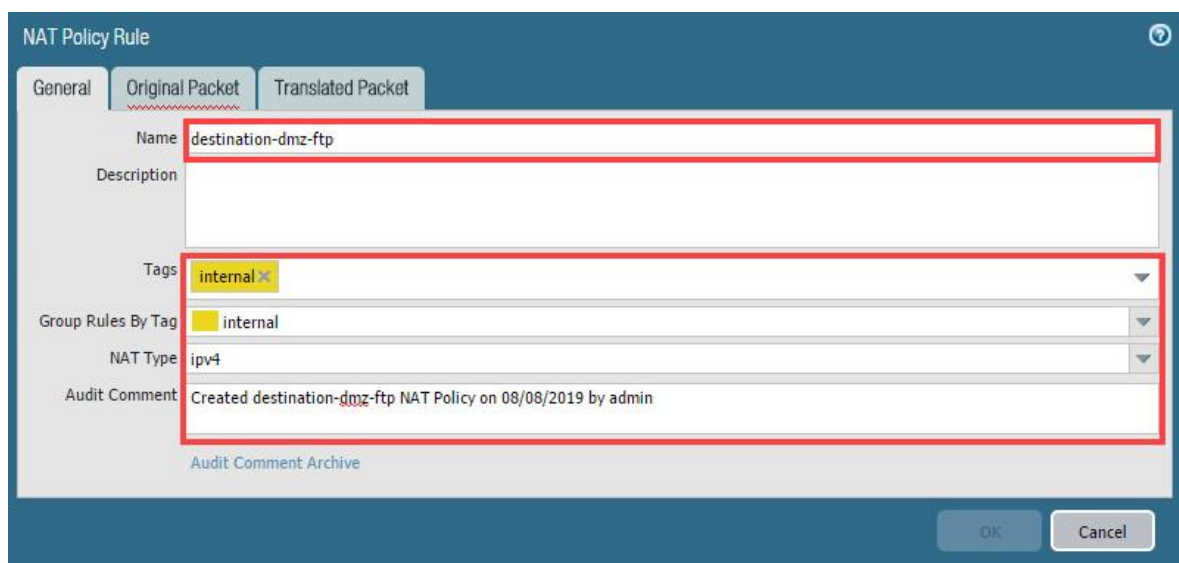

2. Click **Add** to define a new destination NAT policy rule.

3. In the *NAT Policy Rule* window, configure the following:

Parameter	Value
Name	destination-dmz-ftp
Tags	internal
Group Rules By Tag	Select <b>internal</b> from the drop-down list
NAT Type	Verify that <b>ipv4</b> is selected
Audit Comment	Type Created destination-dmz-ftp NAT Policy on <date> by admin

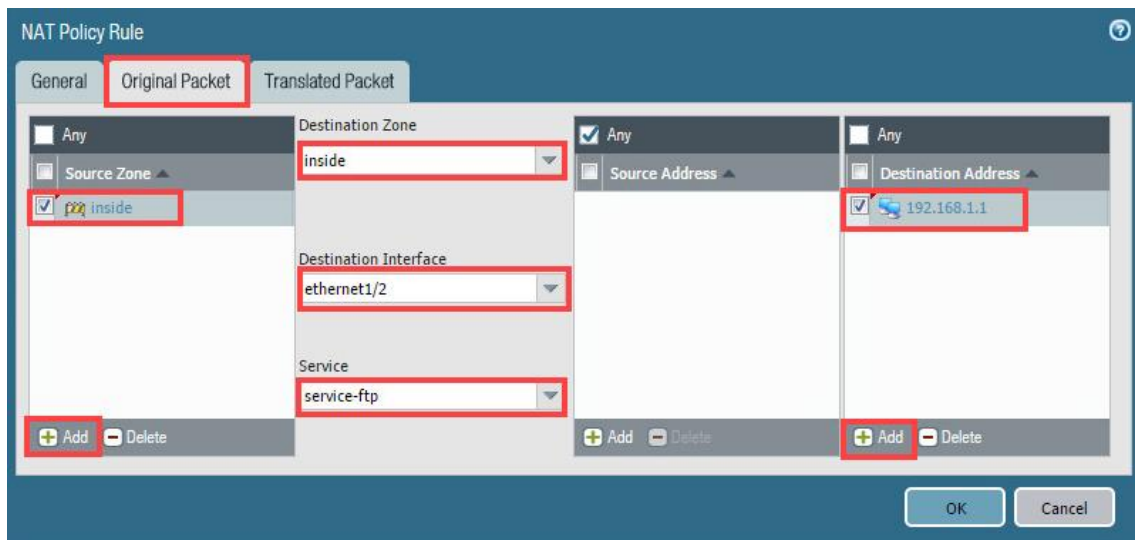

The *Audit Comment* creates an audit trail where you can track the history of changes to the NAT policy rule.

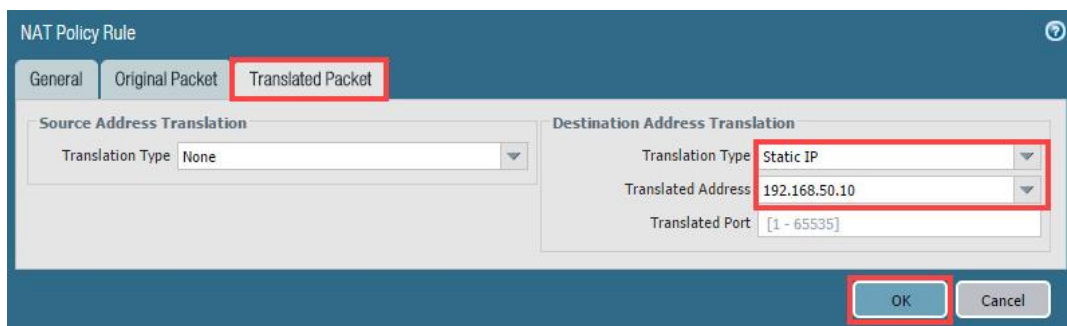

4. In the *NAT Policy Rule* window, click the **Original Packet** tab and configure the following:

Parameter	Value
Source Zone	Click <b>Add</b> and select <b>inside</b>
Destination Zone	<b>inside</b>
Destination Interface	<b>ethernet1/2</b>
Service	<b>service-ftp</b>
Destination Address	Click <b>Add</b> and manually enter <b>192.168.1.1</b>

5. In the *NAT Policy Rule* window, click the **Translated Packet** tab and configure the following. Once finished, click **OK**.

Parameter	Value
Destination Address Translation Type	<b>Static IP</b>
Translated Address	<b>192.168.50.10</b> (address of DMZ Server)

6. Leave the firewall web interface open to continue with the next task.

## 1.7 Create a Security Policy Rule

1. In the web interface, click the **Dashboard** tab.
2. Annotate the current time referenced by the firewall. Do note, however, that the times will be different.

3. Navigate to **Policies > Security**.

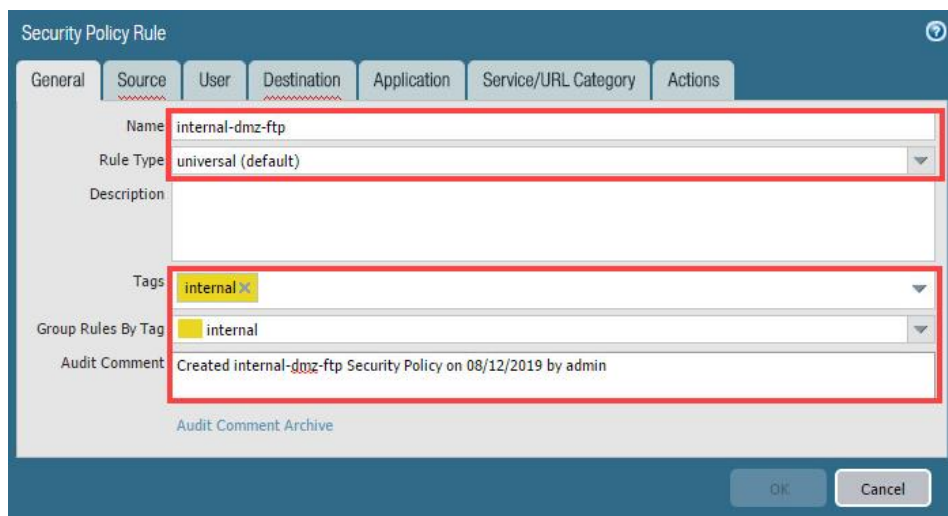

4. Click **Add** to define a new Security policy rule.

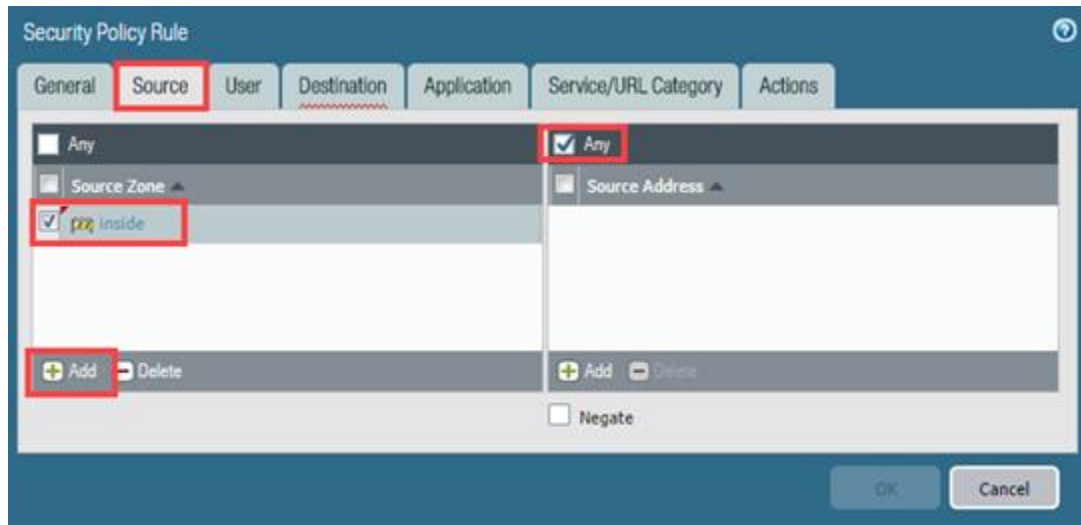

5. In the *Security Policy Rule* window, configure the following:

Parameter	Value
Name	<code>internal-dmz-ftp</code>
Rule Type	<b>universal (default)</b>
Tags	<b>internal</b>
Group Rules By Tag	Select <b>internal</b> from the drop-down list
Audit Comment	Type Created <code>internal-dmz-ftp</code> Security Policy on <date> by admin

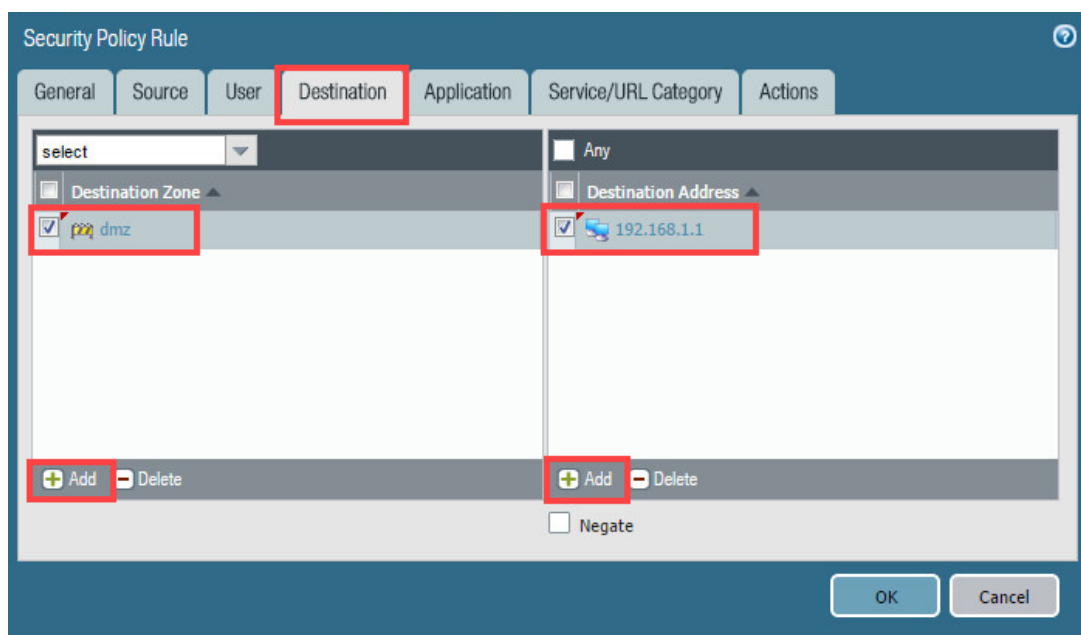

6. In the *Security Policy Rule* window, click the **Source** tab and configure the following:

Parameter	Value
Source Zone	Click <b>Add</b> and select <b>inside</b>
Source Address	Verify that the Any checkbox is selected

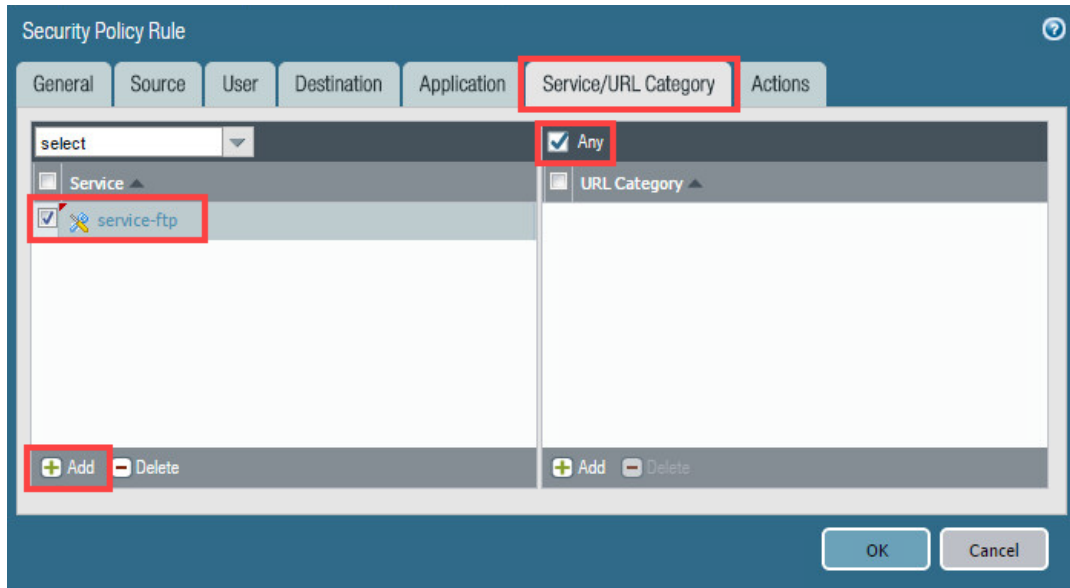

7. In the *Security Policy Rule* window, click the **Destination** tab and configure the following:

Parameter	Value
Destination Zone	Click <b>Add</b> and select <b>dmz</b>
Destination Address	Click <b>Add</b> and manually enter 192.168.1.1

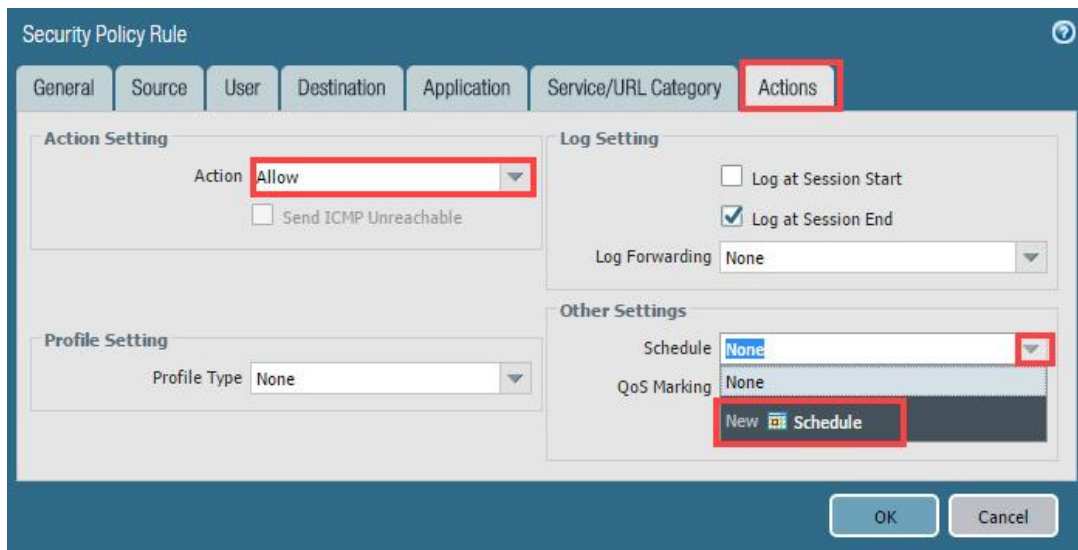

8. In the *Security Policy Rule* window, click the **Service/URL Category** tab and configure the following:

Parameter	Value
Service	Click <b>Add</b> and select <b>service-ftp</b>
URL Category	Verify that the <b>Any</b> checkbox is selected

9. Click the **Actions** tab and verify that **Allow** is selected. Locate the *Schedule* drop-down list and select **New Schedule**.

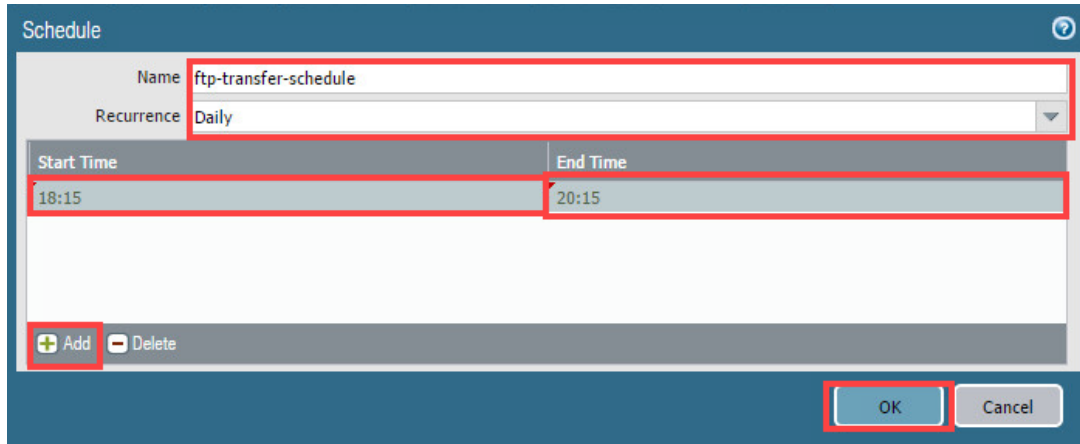

By default, Security policy rules are always in effect (all dates and times). To limit a Security policy to specific times, you can define schedules and then apply them to the appropriate policy rules.

10. In the *Schedule* window, configure the following. Once finished, click **OK**.

Parameter	Value
Name	<code>ftp-transfer-schedule</code>
Recurrence	<b>Daily</b>
Start Time	<b>5 minutes</b> from the time annotated in Step 2 (if exceeded the time, enter a greater time)
End time	Add <b>2 hours</b> from the current firewall time.

Input the values for *Start Time* and *End Time* in 24-hour format.

11. Click **OK** to close the **Security Policy Rule** configuration window.

12. **Commit** all changes.

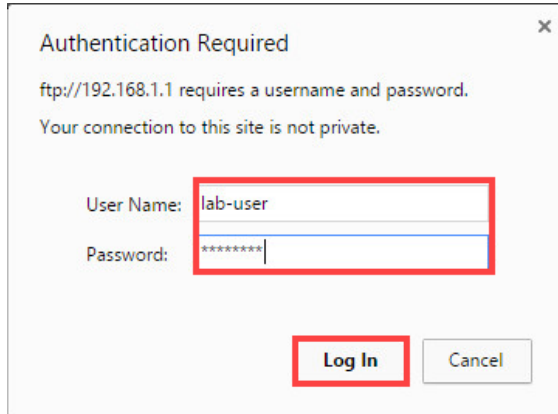

## 1.8 Test the Connection

- Wait for the scheduled time to start (from *Task 1.7, Step 10*) for the *internal-dmz-ftp* Security policy rule.
- Open a new **Chrome** browser window in private mode and browse to `ftp://192.168.1.1`.

3. At the prompt for login information, enter the following credentials and click **Log In**.

Parameter	Value
User Name	lab-user
Password	paloalto

Authentication Required

ftp://192.168.1.1 requires a username and password.  
Your connection to this site is not private.

User Name: lab-user

Password: \*\*\*\*\*

Log In Cancel

The 192.168.1.1 is the inside interface address on the firewall. The firewall is not hosting the FTP server. The fact that you were prompted for a username indicates that FTP was successfully passed through the firewall using destination NAT.

4. Verify that you can view the directory listing and then close the **Chrome** browser window:

5. Change focus to the firewall web interface and navigate to **Monitor > Logs > Traffic**.

6. Find the entries where the application ftp has been allowed by rule *internal-dmz-ftp*.

Destination	To Port	Application	Action	Rule	Session End Reason	Bytes
192.168.1.1	44230	ftp	allow	internal-dmz-ftp	tcp-fin	560
192.168.1.1	21	ftp	allow	internal-dmz-ftp	tcp-fin	2.3k
23.46.56.129	443	ssl	allow	egress-outside	tcp-rst-from-client	3.0k
23.46.56.129	443	ssl	allow	egress-outside	tcp-rst-from-client	1.7k
192.168.1.1	21	ftp	allow	internal-dmz-ftp	tcp-fin	1.1k

Notice the *Destination* address and rule matching.

7. As an alternative method to accessing the Traffic log in the web interface, select **Policies > Security**.

8. From the drop-down icon next to the rule name for **internal-dmz-ftp** (seen when the mouse is hovered over the rule name), select **Log Viewer**.

	Name	Tags	Type	Zone
1	egress-outside	egress	universal	inside
2	internal-dmz-ftp		universal	inside
3	intrazone-default		intrazone	any
4	interzone-default		interzone	any

9. You should see the following:

Source User	Destination	To Port	Application	Action	Rule	Session End Reason	Bytes
	192.168.1.1	44230	ftp	allow	internal-dmz-ftp	tcp-fin	560
	192.168.1.1	21	ftp	allow	internal-dmz-ftp	tcp-fin	2.3k
	192.168.1.1	21	ftp	allow	internal-dmz-ftp	tcp-fin	1.1k

10. The lab is now complete; you may end the reservation.
